                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 1; Page 103-105; 128pp; English.

A cDNA clone (T32960) codes for mouse developmental kinase 1 (MDK1) (M03421), a new member of the eck/eph family of receptor tyrosine kinases (RTKS). To isolate the clone, cDNA from mouse embryos was contificated to PCR amplification with primers based on conserved contificated to PCR amplification with primers based on conserved to screen an 11.5-day-old mouse embryo and an adult mouse brain cDNA ilbrary to obtain the MDK1 clone. 4 Sequence variants (see also T32961-62 and W03422-25) of MDK1 were also identified. MDK1 nucleic acids can be used for the recombinant prodn. of MDK1, as probes to detect MDK1, and for the gene therapy of diseases involving abnormalities in signal transduction, such as neurodegenerative and neuroproliferative disorders and cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence encodes mouse Bsk, which is a receptor-like tyrosine kinase. The nucleic acid sequence encoding Bsk can be used in Bsk nucleic acid probes, which can be used in detecting alterations in the level of Bsk messenger-RNA (mRNA) in biological samples isolated from a mammal afflicted with a disease, such as neurodegenerative diseases or disorders and neoplasms. The nucleic acid sequence can also be delivered into the limbic system of patients with limbic system neuronregenerative disease, disorder or injury, to promote or enhance limbic system neuron regeneration or growth. Such neurodegenerative disease include, chromosomal abnormalities, degenerative growth and development disorders, viral infections, bacterial infections, brain schizophrenia, or stroke and cerebral ischaemia.

Claim 2; Page 8-11; 18pp; English.

Two cDNA libraries were prepared, one from murine osteoblast-
cell line MC3T3-E1 and the other from mouse hepatic tissues.
stranded fragments of 300 bp were obtained using a random ext
primer and were blunt-ended. The ds linker ATOS-1/2 was ligat
the MC3T3-E1 cDNA and the ds linker ATOS-4/5 was ligated to 1
cDNA. PCR amplification of each product was
                                                                                                                                                                                            EP-614974-A.

Claim 1; Page 41-45; 133pp; English.
CDNAs (T02946-49) coding for 4 novel human EPH-like receptor protein
tyrosine kinases, HEK5, HEK7, HEK8 and HEK11 (R85089-92), respectivel
were isolated from a human foetal brain cDNA library using a directed
PCR approach with primers (see T02960-61) based on conserved regions
receptor PTKs and EPH-like receptor PTKs. HEK5, HEK7 and HEK8 show
extensive homology to the catalytic domain of chicken EPH-like
receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known
EPH-like receptor. The isolated cDNAs are used for prodn. of
recombinant HEKs and chimeric receptors, in hybridisation assays, and
to detect abnormalities in HEK receptor genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (Q71304) or ATOS-4 (Q71305), respectively. DNA specific for MC3TT-E1 was obtained by subtraction of sequences also found in liver library, then amplification with ATOS-1. This was a first step in the cloning procedure for isolating a MC3T3-E1 specific clone, coding for OSF-6 (see Q71303).

Claim 1; page 57-62; 133pp; English.
Claim 1; page 57-62; 133pp; English.
cDNAS (T02946-49) coding for 4 novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7, HEK8 and HEK11 (R85089-92), respectively were isolated from a human foetal brain cDNA library using a directed PCR approach with primers (see T02960-61) based on conserved regions creceptor PTKs and EPH-like receptor PTKs. HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cek7, Cek7 and Cek8. HEK11 shows no homology to any known EPH-like receptor. The isolated cDNAs are used for prodn. of recombinant HEKS and chimeric receptors, in hybridisation assays, and

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  332.44

On Nov 15, 1999 this sequence version replaced g1:6114770.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the feature by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chrl
RP1-61A9 is from the library RPCI-1 constructed at the Roswell Park Cancer Institute by the group of Pleter de Jong. For further details see http://bacpac.med.buffalo.edu/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human DNA sequence from complete sequence. IMPORTANT: This sequence is unfinished and does not necessarily
represent the correct sequence. Work on the sequence is in progress
and the release of this data is based on the understanding that the
sequence may change as work continues. The sequence may be
contaminated with foreign sequence from E.coli, yeast, vector,
phage etc. Order of seqments is not known; 800 n's separate
segments. Unfinished: dJ189K14 Contig_ID: 00235

It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

/note="vector: pME185-FL3; Site_1: DraIII (CACTGTGTG);
Site_2: DraIII (CACCATGTG); 1st strand cDNA was primed
with an oligo(dT) primer [ATGTGGCTTTTTTTTTTTTTT];
double-stranded cDNA was ligated to a DraIII adaptor
[TGTTGGCTACTGG], digested and cloned into distinct DraIII
sites of the pME18S-FL3 vector (5' site CACTGTGTG, 3' site
CACCATGTG). XhoI should be used to isolate the cDNA
insert. Size selection was performed to exclude fragments
<1.5kb. Library constructed by Dr. Sundo Sugano
(University of Tokyo Institute of Medical Science) and
kindly donated by Dr. Koichi Kawakami. Custom primers for
sequencing: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end

Oligo-dT track not found, Not I site shown in beginning of sequence is likely internal to the message. CDNA Library Preparation: M.B. Soares Lab Clone distribution: NIH BMAP cDNA clones will be made available by the means that is soon to be determined. When NIH determines the means for distribution of the BMAP cDNA clones, this record will be updated accordingly when that means is determined.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          On Jun 5, 1998 this sequence version Contact: Chin, H National Institute of Mental Health 6001 Executive Blvd. Room 7N-7190, MS 20892-9643, USA

polylinker; Site_1: Not I; Site_2: Eco RI; The
NIH_BMAP_M_S1 ibrary is a subtracted library derived from
NIH_BMAP_M_S1, which in turn is a subtracted library
derived from a mixture of normalized libraries from ten
regions of the mouse brain (cerebellum, brain stems,
olfactory bulbs, hypothalamus, cortex, amygdala, basal
gangila, pineal gland, striatum, hipoccampus). The driver
used for subtraction consisted of a pool of 5,000 clones
from the NIH_BMAP_M_S1 library and a pool of 5,000 clones
obtained from non-normalized and normalized mouse brain
spinal cord libraries.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DB seq
